

Pydantic

First Understand with me

You will have more than all the resources

make or deploy anything in production then this becomes a very big issue.

```
tags: list[str] = ["python", "pydantic", "fastapi"]
quantities: list[int] = [1, 5, 3, 2]
word_counts: dict[str, int] = {"error": 12, "warning": 5}
settings: dict[str, str] = {"theme": "dark", "language": "en"}

print(tags, quantities, word_counts, settings)

(variable) settings: dict[str, str]
```

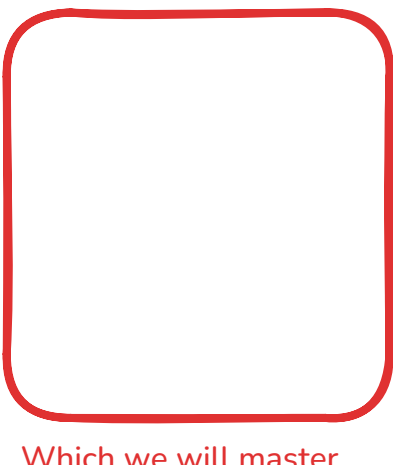

Table with 3 columns: Item, Quantity, Price. It lists various items like '1. Item 1', '2. Item 2', etc., with their respective quantities and prices.

Name: str
PassportNumber: str

class

Dataclass

BaseModel

email -----> Field Validator Field or Type like EmailStr
YOE -----> Field Validator

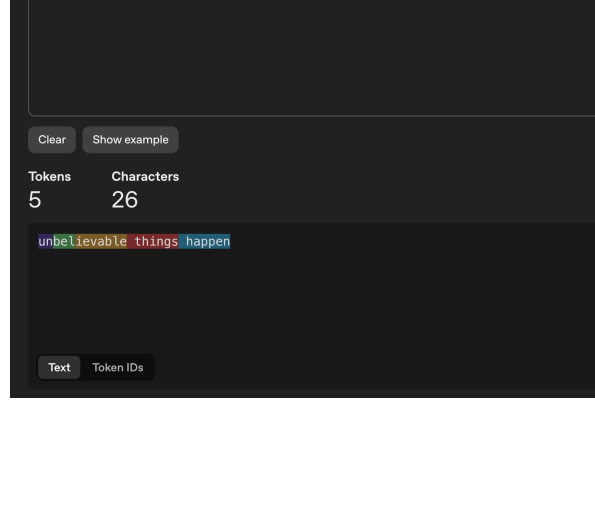

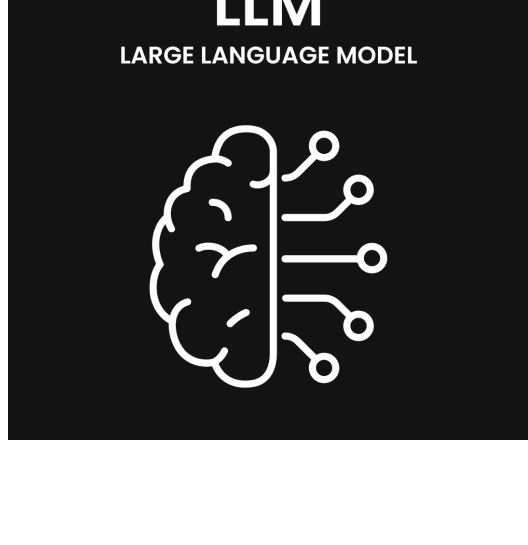

Charged by the minute
more words => More minute Token
Words are currency of Talking

Input Output
For same number of Tokens,
Output is always going to be more expensive
because CHATGPT has to think and answer.

Large Language Models

input output - next token Predictor

chatGPT is to AI
what google is to Internet

input is 5 tokens
& output can be anything but it too will be by tokens

Always output tokens would be expensive than input tokens

output pricing is 6 times the input

Tokens are currency of AI.

5.5

PRICE
\$5 - \$30
Input - Output

input output

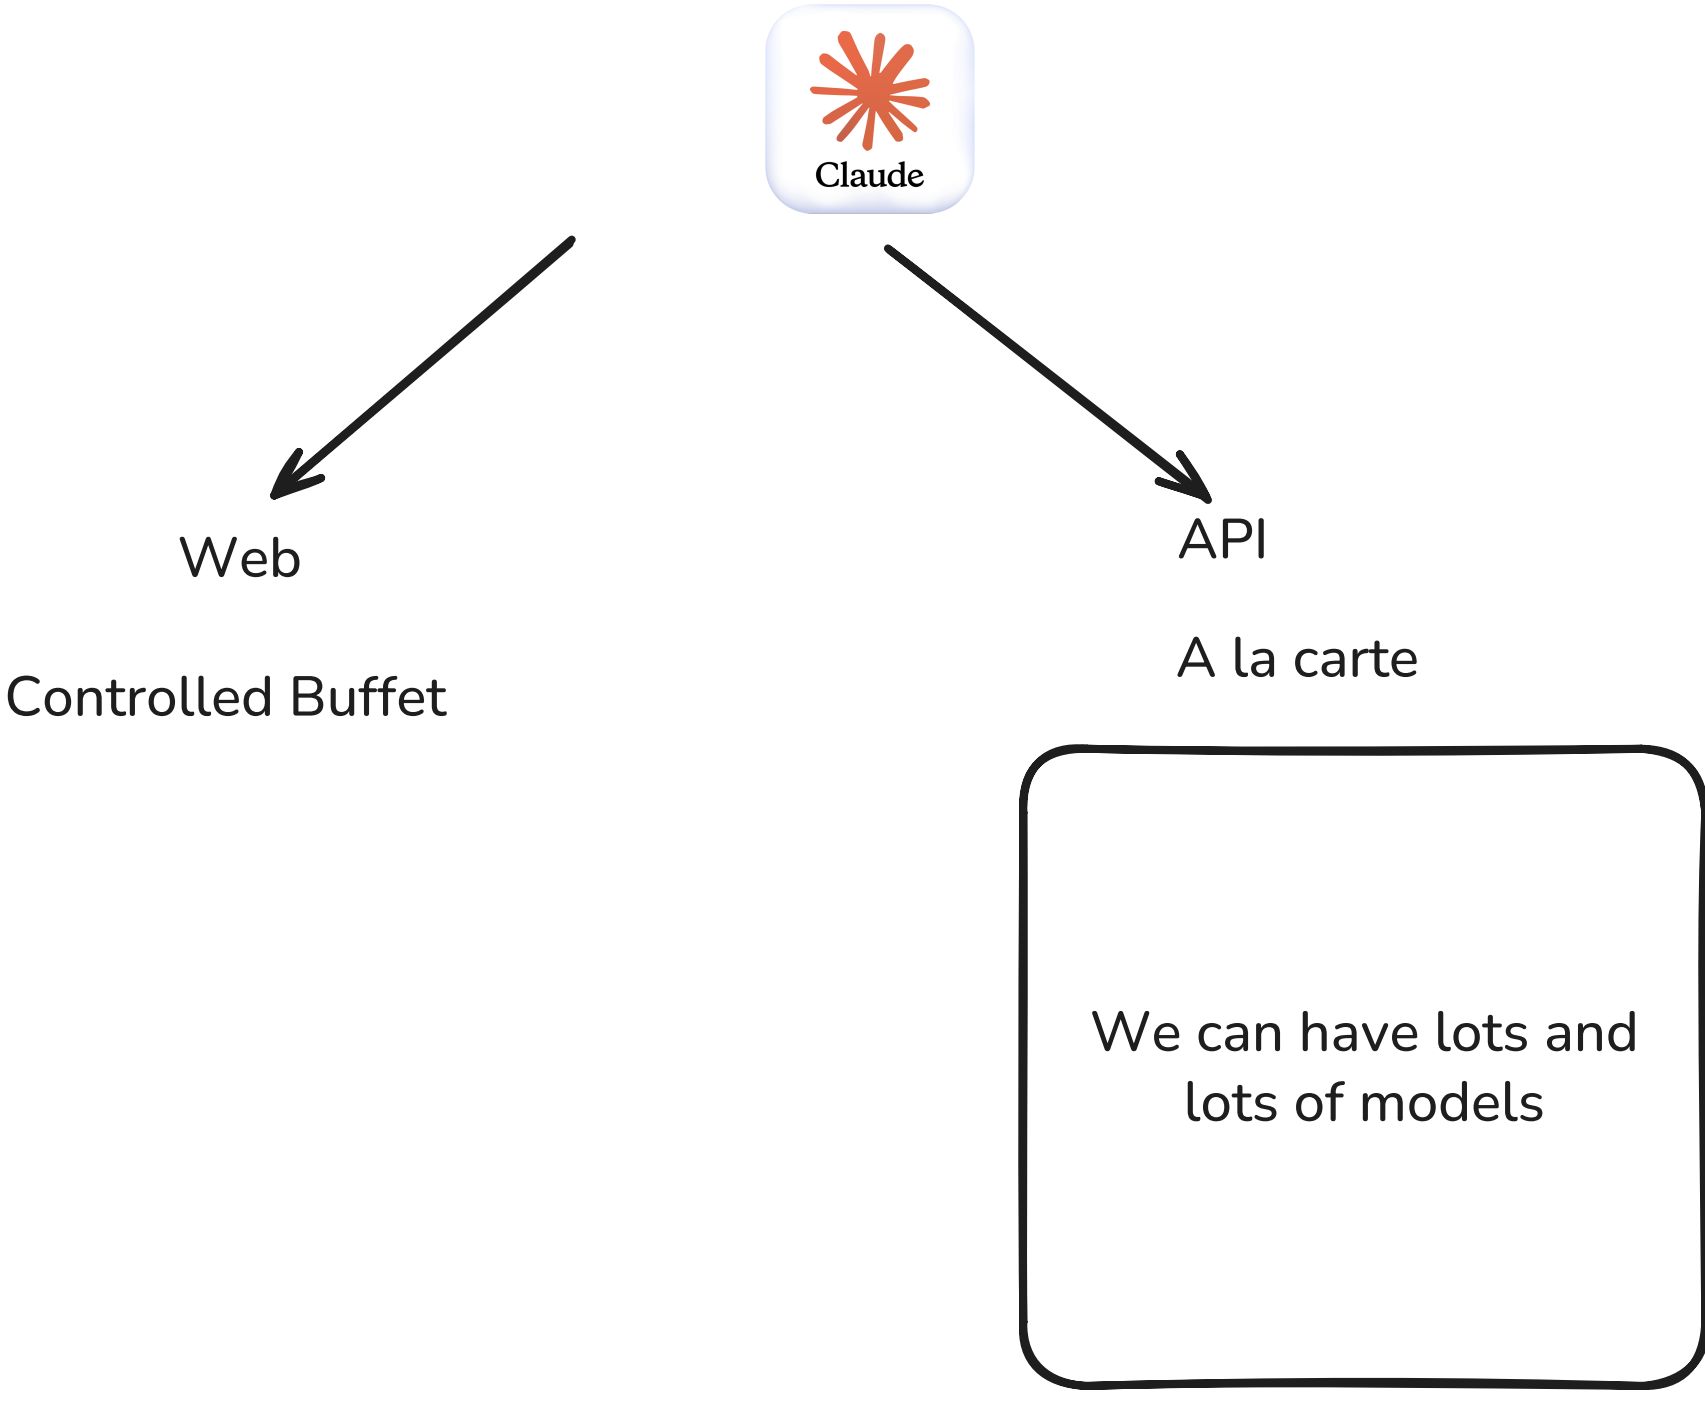

0 knowledge

Vector embeddings are numerical representations of language where text (words, sentences, or documents) is mapped to lists of coordinates in a high-dimensional space. They act as "digital fingerprints" that translate human semantics into numbers, allowing machine learning models to mathematically compare concepts and understand context.

input output

LLM or AI calls are stateless

If I flip between sonnet and opus in same chat, will my context window keep shifting?

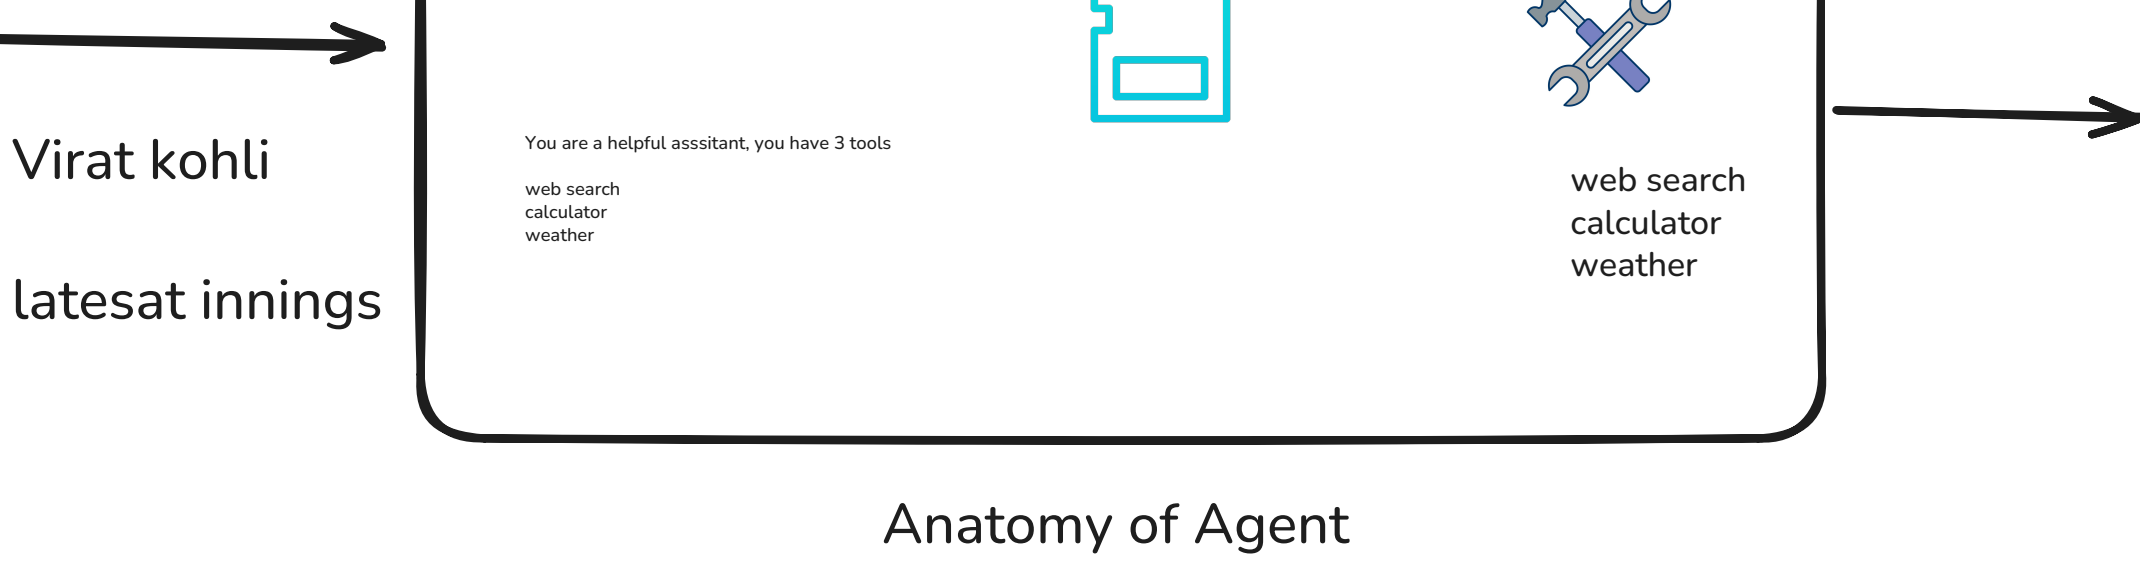

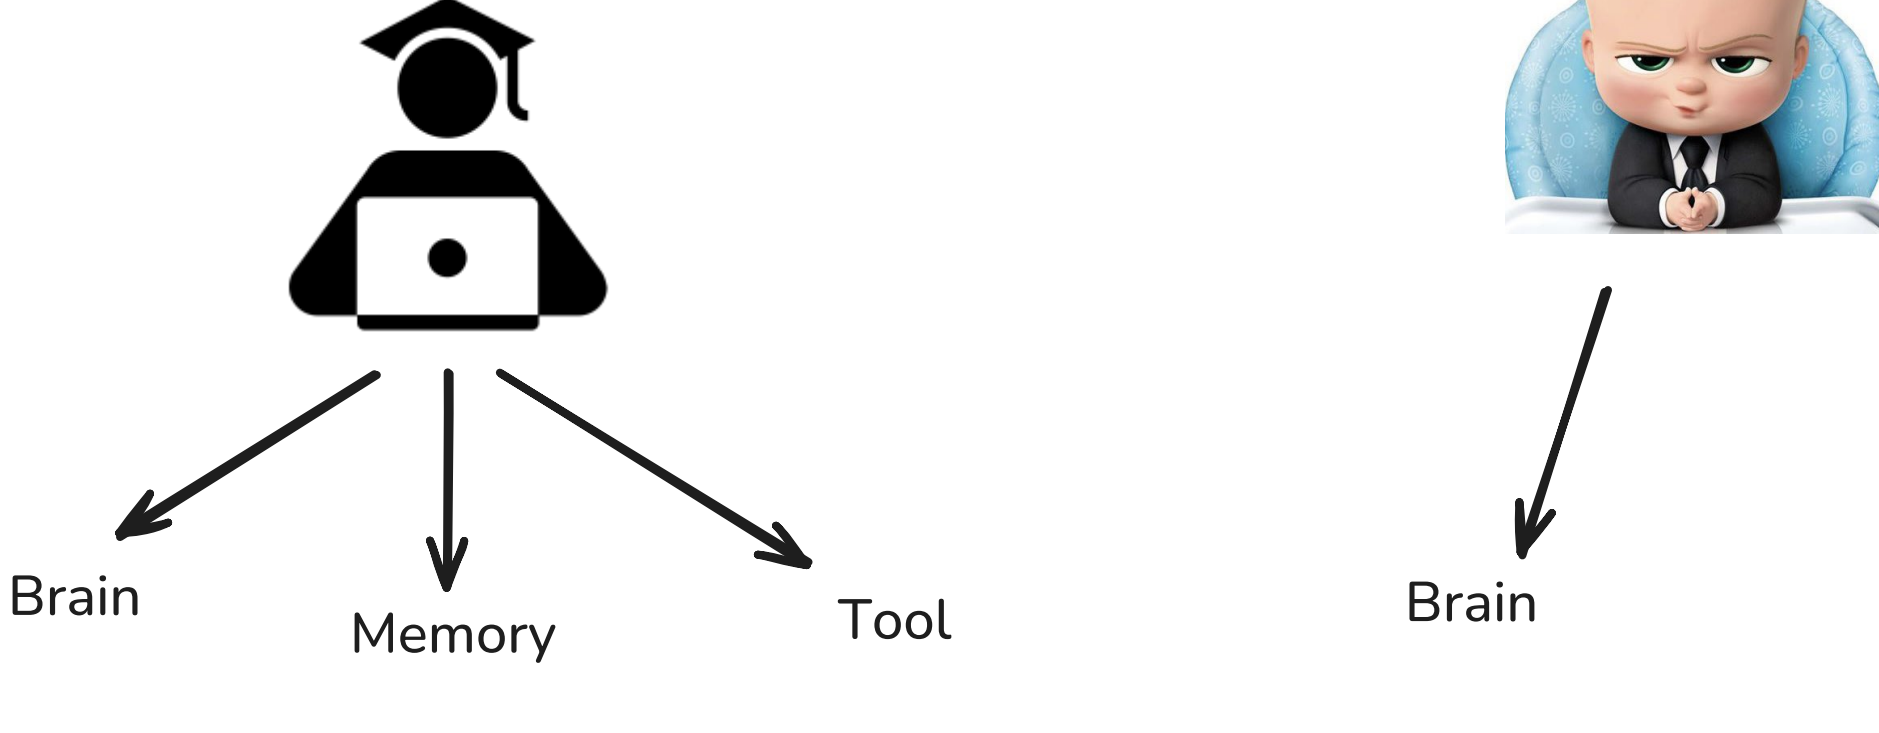

Brain

Intern / Digital Human

Brain + Memory + Tools

As per my understanding AI Agents are like, when we give a task, it figures out the steps and does them. not just answers for the questions we ask.

Anatomy of Agent
